KOMA-Script File scrhack.dtx *

Markus Kohm[†]

2009/04/12

Some packages from other authors may have problems with KOMA-Script. In my opinion some packages could be improved. With some packages this makes only sense, if KOMA-Script was used. With some other packages the package author has another opinion. Sometimes proposals was never answered. Package scrhack contains all those improvement proposals for other packages. This means, scrhack redefines macros of packages from other authors! The redefinitions are only activated, if those packages were loaded. Users may prevent scrhack from redefining macros of individual packages.

^{*}This file is version v3.03b of scrhack.dtx.

[†]mailto:komascript(at)gmx.info

1 The hyperref hack

Package hyperref does behave different at part, chapter, and section headings that get no number. If they get no number, because of to low counter secnumdepth hyperref sets an anchor for links and bookmarks before the heading. Same would be, if the headings have a number. But if the headings get no number because of usage of the star version of the commands, e.g., \part*, \chapter* or \section*, the anchor for links and bookmarks are set after the headings. The anchors for numbered headings are always set before the headings.

Package scrhack redefines some macros of some hyperref driver files, e.g., hpdftex.def, while execution of \begin{document}. With this redefinitions the anchor of not numbered headings will be set always before the headings, too.

You may switch of the hyperref hack loading package scrhack with option hyperref=false. You may also switch of the hyperref hack using \KOMAoptions{hyperref=false} or \KOMAoptions{hyperref}{false} somewhere after loading package scrhack, but before \begin{document}.

2 The float hack

Package float uses macros \float@listhead to set the headings of a float listing and \float@addtolists to add informations to all float listings. These macros where proposed by the KOMA-Script author for some years. In theory those macros may be used by several class and package authors to deligate some parts of the creation of a float listing to the class. This would increase the compatiblity of packages and classes. But unfortunaltly some package authors, even the author of package float, impemented the commands in such a way, that these packages will become incompatible to each other.

Because of this KOMA-Script stopped support for \float@addtolists and \float@listhead with version 3. Instead of this KOMA-Script supports several improvements for package authors using KOMA-Script package tocbasic.

Package scrhack redefines some macros of package float to not longer use \float@addtolists and \float@listhead but use the interface of package tocbasic. This does not only improve the compatibility of KOMA-Script and package float, but also improves the compatibility of packages babel and float.

Note: A significant change with scrhack is, that KOMA-Script options like lists=totoc or lists=totocnumbered does only change the behaviour of float listings, that are already defined using \newfloat before using such an option!

You may switch of the float hack loading package scrhack with option float=false. You may also switch of the float hack using \KOMAoptions{float=false} or \KOMAoption{float}{false} somewhere after loading package scrhack, but before loading package float.

3 The listings hack

Package listings uses macros \float@listhead to set the headings of a float listing, if defined, and \float@addtolists to add informations to all float listings. These macros where proposed by the KOMA-Script author for some years. In theory those macros may be used by several class and package authors to deligate some parts of the creation of a float listing to the class. This would increase the compatiblity of packages and classes. But unfortunaltly some package authors, even the author of package float, impemented the commands in such a way, that these packages may become incompatible to each other.

Because of this KOMA-Script stopped support for \float@addtolists and \float@listhead with version 3. Instead of this KOMA-Script supports several improvements for package authors using KOMA-Script package tocbasic.

Package scrhack redefines some macros of package listings to not longer use \float@addtolists and \float@listhead but use the interface of package tocbasic. This does not only improve the compatibility of KOMA-Script and package listings, but also improves the compatibility of packages babel and listings.

Note: A significant change with scrhack is, that KOMA-Script options like lists=totoc or lists=totocnumbered does only change the behaviour of \listoflistings, if they are set after loading package listings.

You may switch of the listings hack loading package scrhack with option listings=false. You may also switch of the listings hack using \KOMAoptions{listings=false} or \KOMAoption{listings}{false} somewhere after loading package scrhack, but before loading package listings.

4 Implementation of scrhack

4.1 Optionen

Das Paket bedient sich \KOMAoptions etc. aus scrkbase.

Per Option kann gewählt werden, welche Manipulationen geladen werden sollen. Alle diese Optionen können jedoch nur bis zum Laden des entsprechenden Pakets gesetzt werden. Anschließend sind sie wirkungslos.

4.2 Der hyperref-Hack

hyperref setzt den Anker zu der Stern-Variante einer Überschrift hinter die Überschrift, während es bei der nicht Stern-Variante den Anker auch dann vor die Überschrift setzt, wenn die Überschrift aufgrund von secnumdepth nicht nummeriert wird. Der Hack setzt den Anker einheitlich vor die Überschrift.

hyperref

```
1 \KOMA@ifkey{hyperref}{@scrhack@hyperref}%
2 \@scrhack@hyperreftrue
3 \AtBeginDocument{%
4 \KOMA@key[.scrhack.sty]{hyperref}{%
5 \PackageWarning{scrhack}{option 'hyperref=#1' ignored}%
6 }%
7 \if@scrhack@hyperref\scr@hack@load\@pkgextension{hyperref}\fi
8 }
```

\@schapter \@spart \@ssect Eigentlich wird hier gar nicht hyperref.sty verändert, sondern diverse Treiberdateien. Sobald das Paket hyperref geladen ist, ist auch die passende Treiberdatei geladen und außerdem sind alle Treiberdateien, die entsprechende Definitionen vornehmen, gleichermaßen betroffen. Also kann der entsprechende Patch einfach erfolgen, wenn hyperref geladen ist (was bereits von \scr@hack@load getestet wurde). Es muss also nur noch sichergestellt werden, dass die umzudefinierenden Macros derzeit den erwarteten Inhalt haben.

4.3 Der float-Hack

Das float-Paket verwendet das Makro \float@listhead zum Setzen der Überschriften. Dies wird seit KOMA-Script 3 nicht mehr empfohlen und fliegt demnächst komplett aus der Unterstützung. Stattdessen wird empfohlen, dass Pakete tocbasic unterstützen. Der Aufwand dafür ist sehr gering und wird mit vielen neuen Möglichkeiten belohnt.

Dieser Hack rüstet die tochasic-Unterstützung für float nach.

float

```
111 \KOMA@ifkey{float}{@scrhack@float}%
112 \@scrhack@floattrue
113 \AfterPackage*{float}{%
114 \KOMA@key[.scrhack.sty]{float}{%
115 \PackageWarning{scrhack}{option 'float' ignored}%
116 }%
117 \if@scrhack@float\scr@hack@load\@pkgextension{float}\fi
118 }
```

\newfloat Über die Anweisung \newfloat wird eine neue Gleitumgebung definiert.

Hier muss die neue Erweiterung aus dem dritten Argument tocbasic bekannt gemacht werden.

\listof Über die Anweisung \listof wird ein Verzeichnis für Gleitumgebungen ausgegeben. Hier muss schlicht die entsprechende Anweisung von tochsic verwendet werden.

\float@addtolists Diese Anweisung wird nicht länger benötigt und daher auf die ursprüngliche Definition zurückgesetzt.

```

4.4 Der listings-Hack

Das listings-Paket verwendet das Makro \float@listhead zum Setzen der Überschriften. Dies wird seit KOMA-Script 3 nicht mehr empfohlen und fliegt demnächst komplett aus der Unterstützung. Stattdessen wird empfohlen, dass Pakete tocbasic unterstützen. Der Aufwand dafür ist sehr gering und wird mit vielen neuen Möglichkeiten belohnt.

Dieser Hack rüstet die tocbasic-Unterstützung für listings nach.

listings

```
206 \KOMA@ifkey{listings}{@scrhack@listings}%
207 \@scrhack@listingstrue
208 \AfterPackage*{listings}{%
     \KOMA@key[.scrhack.sty]{listings}{%
209
       \PackageWarning{scrhack}{option 'listings' ignored}%
210
211
     \if@scrhack@listings\scr@hack@load\@pkgextension{listings}\fi
212
213 }
```

\scr@do@hack@listings

Über dieses Macro wird das Verzeichnis der Listings gesetzt. Die gesamte \lstlistoflistings Funktionalität dafür kann tocbasic überlassen werden.

\float@addtolists

Diese Anweisung wird nicht länger benötigt und daher auf die ursprüngliche Definition zurückgesetzt. Da listings ihre Definition mit \AtBeginDocument verzögert, muss dies hier ebenfalls geschehen.

```
